

Dockerfile >

Use the official PHP with Apache image as the base image

FROM php:7.4-apache

Copy your PHP application files into the container

COPY . /var/www/html/

Expose port 80 to allow outside access to your container

EXPOSE 80

Image Building step >

```
PS D:\MICRO PROJECTS\WAD\web-app\server> docker build -t travel-helper:php .
```

```
PS D:\MICRO PROJECTS\WAD\web-app\server> cd ..
```

```
PS D:\MICRO PROJECTS\WAD\web-app> docker build -t travel-helper:php .
```

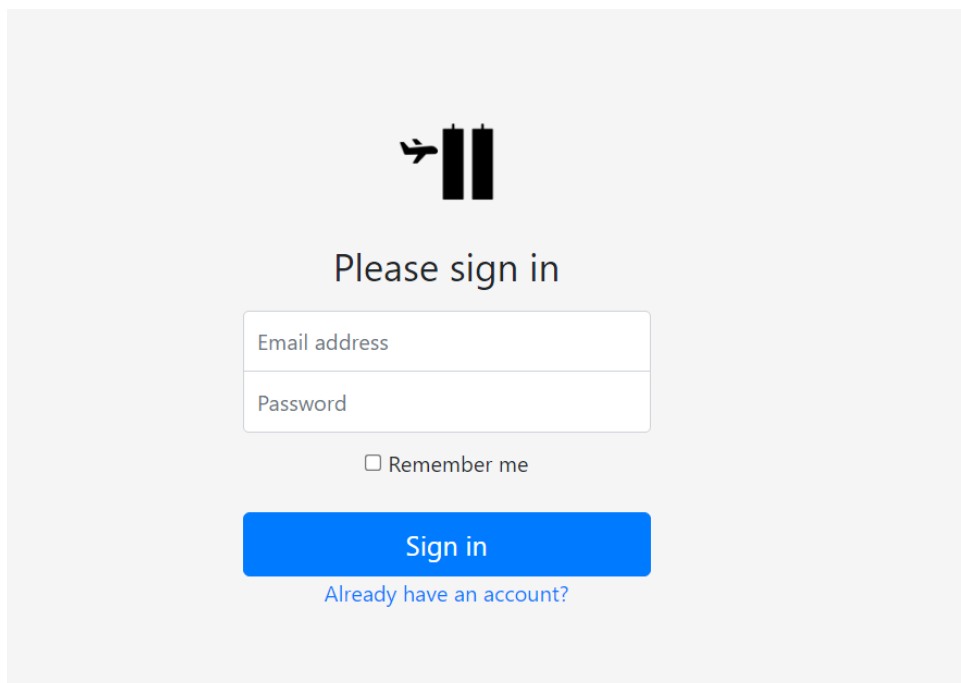

```
[+] Building 161.5s (8/8) FINISHED
```

Running Container >

```
PS D:\MICRO PROJECTS\WAD\web-app> docker run -d -p 8080:80 travel-helper:php
```

```
805faa3cddaba254d4da0d3adc964b2ac8e166a9733f55a1cd448428558ec998
